

JONATHAN NADEAU

DATA & OPERATIONS ANALYST

Torrance, CA | (310) 989-2905 | nadeau.jonny@gmail.com | linkedin.com/in/nadeau-jonathan
Portfolio Website: nadeaujonny.github.io | github.com/nadeaujonny

Dear Hiring Manager,

Thank you for considering my application. I hold a B.A. in Mathematics from UC Santa Barbara and the Google Data Analytics Professional Certificate, which I completed with a 100% average across all nine courses, and I am currently the sole developer on internal analytics and automation tooling at Escape Communications, a defense and telecom electronics manufacturer in Torrance. I am a U.S. person and ITAR eligible, I am based in the South Bay, and I am completing the UCLA Extension Data Science Certificate this December.

At Escape I have delivered eight production tools, owning each one from requirements through testing, packaging, and deployment. The bill of materials sourcing tool prices and risk-assesses entire BOMs against the DigiKey and Mouser APIs, reducing a purchasing workflow the VP of Engineering estimated at roughly 13 hours per BOM to about 3 minutes. The failure analysis search tool ingests 4,038 undocumented hardware failure records spanning 2007 through 2026 by REST API, indexes 2,245 reference designators out of 13,252 free-text engineer comments, and serves them through a Streamlit interface that cut typical query time from about 6 seconds to 0.5. Most recently I reverse-engineered six undocumented ISO 9001 clause 9.1 management review reports from 20 archived workbooks and 16 database schemas, reproduced four consecutive years of historical output exactly, and surfaced four material errors in the existing record, including a prior-year figure that was wrong by a factor of 3.4 and had been carried forward for two years.

Alongside that work I maintain fifteen deployed portfolio projects. They include a closed-loop supply chain pipeline over roughly 180,000 order records in Oracle SQL with an MRP net requirements simulation, ABC/XYZ segmentation, ETS demand forecasting with Solver-optimized safety stock, and a six-page Power BI dashboard on a star schema with row-level security; a fully articulating three-statement financial model for Skechers rebuilt from SEC 10-K filings with scenario switching and sensitivity tables; and a customer churn pipeline in which I selected logistic regression over a tuned alternative that traded 22 points of recall for a negligible gain in AUC. Day to day I work in SQL, Excel including Power Query and DAX, Power BI, Tableau, Python, and R.

The part of this work I find most useful is the part before the analysis starts. Every tool above began with sitting down with the lab technician, the FPGA engineer, or the VP and finding out what the output actually needs to answer, then profiling the real data before writing anything. Three years and 1,500 hours of teaching mathematics gave me a great deal of practice explaining quantitative results to people who do not want the derivation, and that has carried over directly to walking decision-makers through a report they are going to act on.

I will be straightforward about the gap: my production experience comes from one employer rather than several, and I am early in this career rather than mid-way through it. What I can show is that I scope work with the people who use it, verify results before shipping them, and do not put a number in front of anyone that I cannot trace back to a source. I would welcome the opportunity to discuss how I can contribute to your team, and my full portfolio and source code are available at the links above.

Sincerely,

Jonathan Nadeau
